DISASTER DATA

This book explains the supporting data required by the Bank in developing Stress Tests related to the impact of climate change risks, especially physical risks. The data and methodology used are sourced from disaster data published by the National Disaster Management Agency (BNPB). As the scope of disasters that are included in this stress test are floods and forest fires.

The data available in this guide is historical Disaster Data and Information in Indonesia (DIBI) and the Indonesian Disaster Risk Index (IRBI) which banks can use to measure the impact of physical risk on banking performance. Disaster Data and Information in Indonesia (DIBI) is a database that displays data on the number of disaster events in Indonesia. Meanwhile, IRBI is a disaster risk index based on hazard, vulnerability and capacity,

where hazard is calculated based on the spatial probability, frequency and strength (magnitude) of a natural phenomenon such as earthquakes, floods, volcanic eruptions and others. Vulnerability is calculated based on socio-cultural, economic, physical and environmental parameters. Capacity is assessed using a regional resilience level approach based on seven priorities, namely: (1) Strengthening policies and institutions; (2) Risk assessment and integrated planning; (3) Development of information systems, training and logistics; (4) Thematic handling of disaster-prone areas; (5) Increasing the effectiveness of disaster prevention and mitigation; (6) Strengthening disaster preparedness and emergency management; and (7) Development of a disaster recovery system.
